DIGITAL COMMUNICATION SYSTEM

ÒÃÕÍ È×ÃÑÊÎ Æ ĐÓÊÎ ÆÎ ÄÑÒÆÎ

## **PART 1. INTRODUCTION TO PROGRAMMING**

### **1.1 PROGRAMMING OVERVIEW**

The SAMSUNG DCS system arrives from the factory with default data. Connect it to trunk, stations and power, turn the system on and it is fully operational.

The only thing left to do is customize the data to fit the customer's needs. This is called programming the system.

MMC stands for Man Machine Code and each program is assigned a different three three digit code. These MMC codes are used to view, create or change customer data. Programming is simply deciding what needs to be done and knowing which MMC is used to do it. For example, use MMC 601 to be create a station group. System speed dial numbers are entered in MMC 705 and soft keys are assinged to individual keysets using MMC 722.

System programming may be done from any LCD 12B or 24B keyset. The first thing you must do is open system programming. As a security measure, a passcode must be known to do this. Figure 1-1 illustrates the keys on a display keyset that have special functions during programming. When required, these keys will be referred to by the names described in the diagram.

### **1.2 PROGRAMMING LEVELS**

There are three levels of programming: SYSTEM, CUSTOMER and STATION. System and customer levels are under passcode protection while station programming does not require a passcode.

To prevent conflicting data from being entered, only one person at a time can enter programming with the technician or customer passcode. While programming is in progress, normal system operation is not affected. For your convenience, the system display [xxx IN PGM MODE] when another keyset is in the program mode.

#### **A. System level**

This level is entered via MMC 800 and requires the technician level passcode. It allows access to all system programs, station programs and maintenance programs.

#### **B. System level**

This level is entered via MMC 200 and requires the customer passcode. It allows access to station programs and system programs allowed by the technician in MMC 802. When using the customer passcode to access station programs, data for all stations can be viewed or changed.

**NOTE:** When the system is programmed for multiple tenant use, each tenant has an individual customer passcode enabled in MMC 201. The access for tenant passcode is limited to only certain MMCs. See MMC 201 for more details.

After opening programming with the customer passcode, you must press TRSF to exit. Now press TRSF and the MMC number you wish to access.

### **C. System level**

All keysets can access station programs 102-117 without using a passcode. Each user can only change station data for his/her own keyset.

When the LCD 12B or LCD 24B keyset is in programming, the display shows instructions prompts and choices. Existing data is always displayed before it can be changed. The keystroke sequence for each MMC is detailed in the following pages.

Before you begin entering customer data, follow this important reminder.

#### **IMPORTANT REMINDER**

When first installing this system, always use MMC 811 to reset and clear memory.  
This will ensure that you begin with clean default data.

Now begin entering customer data.

## Part 2. Programming Procedures

### 2.1 Program List

100:	Station Lock	313:	Assign PIN Code
101:	Change User Passcode	400:	Customer On/Off per Trunk
102:	Call Forward	401:	C.O./PBX Line
103:	Set Answer Mode	402:	Trunk Dial Type

# MMC: 100

# STATION LOCK

## DESCRIPTION:

Allows the system administrator or technician to lock or unlock an individual station or all stations simultaneously. The three options are as follows:

0	UNLOCKED	Unlocks a locked station
1	LOCKED OUT	The mode just not allowed to access CO line for dial out
2	LOCKED ALL	Not allowed to initiate any action with this mode

## PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right
SPK	Used to store data and advance to next MMC
HOLD	Used to clear previous entry
ANS/RLS	Used to select ALL

## ACTION

1. Press TRSF 100  
Display shows
2. Dial station number (e.g., 205)  
OR  
Use UP and DOWN to select station  
and use RIGHT soft key to move cursor  
OR  
Press ANS/RLS to select all stations
3. Enter 0 to unlock or 1 to lock (e.g., 1)  
OR  
Press UP or DOWN key to make  
selection and press RIGHT soft key  
to return to step 2
4. Press TRSF to save and exit  
OR  
Press SPK to save and advance  
to next MMC

## DISPLAY

??

[205] STN LOCK  
LOCKED OUT

**DEFAULT DATA: ALL STATIONS UNLOCKED**

**RELATED ITEMS: STATION USER PROGRAMMING**

# MMC: 101 CHANGE USER PASSCODE

## DESCRIPTION:

Allows the system administrator or technician to reset any keyset's passcode to its default value of "1234". This MMC cannot display station passcodes; it can only reset them to default.

Keyset users can set or change their individual passcodes. The passcode is used to lock or unlock the keyset and for toll restriction override and to access the DISA feature.

NOTE: Default passcodes cannot be used for toll restriction override or for DISA access.

## PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right
SPK	Used to store data and advance to next MMC
HOLD	Used to clear previous entry

## ACTION

1. Press TRSF 101  
Display shows
2. Dial keyset number (e.g., 205)  
OR  
Use UP or DOWN to scroll through keyset numbers and press RIGHT soft key to move the cursor right
3. Press HOLD to reset passcode
4. Press TRSF to store and exit  
OR  
Press SPK to store and advance to next MMC

# MMC: 102 FORWARD

# CALL

## DESCRIPTION:

Allows the system administrator to program the call forward destinations for other station users. The MMC also allows call forward to be set after the destination has been entered.

The DCS system allows five types of call forwarding. FORWARD ALL, FORWARD NO ANSWER, FORWARD BUSY, FORWARD FOLLOW ME and FORWARD EXTERNAL. There is an additional option, FORWARD BUSY/NO ANSWER, that allows both of these options to be activated at the same time, provided that destinations have been entered for both.

0 = FORWARD CANCEL  
1 = ALL CALL  
2 = BUSY

3 = NO ANSWER  
4 = BUSY/NO ANSWER  
5 = EXT

## PROGRAM KEYS

# MMC: 103 MODE

# SET ANSWER

## DESCRIPTION:

Allows a system administrator to change the answer mode of any keyset or add-on module. Each keyset or add-on module can have its answer mode set to one of the following options:

0. RING: The keyset will ring in one of eight custom ring patterns. Calls are answered by pressing the ANS/RLS key or by lifting the handset.

1. AUTO: After giving a short attention tone, the keyset will automatically answer calls on the speakerphone. When a C.O. line is transferred to a keyset in Auto Answer, the screened portion of the call will be Auto Answer, but the keyset or add-on module (AOM) will ring when the transfer is complete if the user has not pressed the ANS/RLS key or lifted the handset.

2.. VOICE: The keyset will not ring. After a short attention tone, callers can make an announcement but the ANS/RLS key or handset must be used to answer calls.

## PROGRAM KEYS

# MMC: 104 STATION NAME

## DESCRIPTION:

Allows the system administrator or technician to enter a eleven (11) character name to identify an individual station.

Names are written using the keypad. Each key press selects a character. Pressing the dial pad key moves the cursor to the next position. For example, if the directory name is "SAM SMITH," press the number "7" three times to get the letter "S." Now press the number "2" once to get the letter "A." Continue selecting characters from the table below to complete your message. Pressing the bottom left programmable key will change the letter from upper case to lower case.

NOTE: When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right.

COUNT	1	2	3	4	5
DIAL 0	Q	Z	.	)	0
DIAL 1	space	?	,	!	1
DIAL 2	A	B	C	@	2
DIAL 3	D	E	F	#	3
DIAL 4	G	H	I	\$	4
DIAL 5	J	K	L	%	5
DIAL 6	M	N	O	^	6
DIAL 7	P	R	S	&	7
DIAL 8	T	U	V	*	8
DIAL 9	W	X	Y	(	9
DIAL *	:	=	[	]	*

The # key can be used for the following special characters: #, space, &, !, :, ;, ?, ., %, \$, -, <, >, /, =, [, ], @, ^, (, ), \_ , +, {, }, |, ;, \, " and ~.

## PROGRAM KEYS

# STATION SPEED DIAL

## DESCRIPTION:

Allows the system administrator or technician to program the personal speed dial locations assigned to a station. This must be done for single line telephones because these stations cannot access programming. Each station may have up to 50 locations or bins assigned to it in MMC 606 Assign Speed Block. The speed dial bins are numbered 00–49. Each speed dial number consists of a trunk or trunk group access code followed by a separator and up to 18 digits to be dialed. These dialed digits may consist of 0–9, \* and #. If the system recognizes a valid trunk or trunk group access number, it will automatically insert the separator.

## PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right
SPK	Used to store data and advance to next MMC
HOLD	Used to clear previous entry
B	Used to insert a flash code "F"
C	Used to insert a pause code "P"
D	Used to insert a pulse/tone conversion code "C"
E	Used to mask/unmask following digits (shows as "[ " or "]")
F	Used to enter name for speed dial bin (see MMC 106)

## ACTION

## KEY

### DESCRIPTION:

Use this program to view the programmable keys assigned to keyset station. In addition it allows the system administrator to assign key extenders to some keys making a general access feature key more specific. The feature keys that can have extenders are listed below.

FEATURE KEY	EXTENDER
BOSS	Boss and Secretary (1-4)
DIR	Directory dial by name type (1-3)
DP	Direct Pick Up (extension or station group number)
DS	Direct Station Select (station number)
FWRD	Call Forward (0-5)
GPIK	Group Pick Up (01-20)
IG	In/Out group (Station Group Number)
MMP	Meet Me Page (0-9, *)
PAGE	Page (0-9, *)
SG	Station Group (500-529)
SPD	Speed Dial (00-49, 500-999)
SP	UCD Supervisor (UCD Group Number)
PSM	Programmed Station Message (01-20)

### PROGRAM KEYS

# KEYSET ON/OFF

## DESCRIPTION:

Allows the system administrator to set any of the keyset features listed below.

- |    |             |   |
|----|-------------|---|
| 0. | AUTO HOLD   | Automatically places an existing C.O. call on hold if a CALL button, trunk key or trunk route key is pressed during that call.    |
| 1. | AUTO TIMER  | Automatically starts the stopwatch timer during a C.O. call.  |
| 2. | HEADSET USE | When on, this feature disables the hookswitch allowing a headset user to answer all calls by pressing the ANS/RLS button.         |
| 3. | HOT KEYPAD  | When on, this feature allows the user to dial directory numbers without having to first lift the handset or press the SPK button. |
| 4. | KEY TONE    | Allows the user to hear a slight tone when pressing buttons on his/her set.   |
| 5. | PAGE REJOIN | Allows the user to hear the latter part of page announcements if his/her keyset becomes free during a page.                       |
| 6. | RING PREF.  | When off, requires the user to press the fast flashing button to answer a ringing call after lifting the handset.                 |
| 7. | CALL COST.  | If enabled (ON), LCD shows real time call cost calculated based on Metering Pulses arrived.                                       |

# ALARM AND MESSAGE

## DESCRIPTION:

Allows the system administrator or technician to set or change the alarm clock/appointment reminder feature for any station. This must be done for single line telephone because they cannot access programming. Three alarms may be set for each station and each alarm may be defined as a one-time, TODAY alarm or as a DAILY alarm as described below. The TODAY alarm is automatically canceled after it rings, while the DAILY alarm rings every day at the same time. It is also possible to set a message to display when the alarm is sounded. Alarm numbers are 1, 2 and 3.

Eynry	Alarm Type
DIAL 1	NOTSET
DIAL 2	TODAY
DIAL 3	DAILY

Messages are written using the keypad. Each press of a key will select a character. Pressing the dial pad key will move the cursor to the next position. For example, if the directory name is "SAM SMITH," press the number "7" three times to get the letter "S." Now press the number "2" once to get the letter "A." Continue selecting characters from the table below to complete your message. Pressing the "A" key will change the letter from upper case to lower case.

COUNT	1	2	3	4	5
DIAL 0	Q	Z	.	)	0

# ASSIGN UA

## DESCRIPTION:

Assigns ringing device to be accessed when a Universal Answer (UA) key is pressed or the UA pickup code is dialed. To assign UA, assignment is made in MMC 601 Assign Station Group for a group and then the group is entered here. The UA device may be one of the two device types listed below. The device type is automatically determined by the directory number (DN) entered.

DIRECTORY NUMBER	DEVICE TYPE	DESCRIPTION
201-349	STATION	The UA device is a keyset or SLT.
3601-3602	ROP	Ring over page.
500-529	STATION GROUP	The UA device is a station group.

NOTE: Only one of the above options can be selected. If the ability to ring more than one item (e.g., all four external page zones) is required, a station group containing all four zone codes must be created.

## PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter DN of selected device
SPK	Used to store data and advance to next MMC
HOLD	Used to clear previous entry

## ACTION

1. Press TRSF 203  
Display shows current assignment
2. Dial DN of UA device (e.g., 205)  
OR  
Use UP and DOWN keys to scroll through available devices  
Press RIGHT soft key to return to this step
3. Press TRSF to store and exit  
OR  
Press SPK to store and advance to next MMC

## ASSIGN LOUD

### DESCRIPTION:

Designates the station that controls the loud bell ring output of a Trunk A card. Each Trunk A card has one loud bell output; these outputs are given a DN of 3901–3920 as a default value to enable them to be assigned.

The loud bell will follow the ring cadence of the designated station. Only a station can be assigned to control the loud bell; a station group cannot be assigned.

### PROGRAM KEYS

# MMC: 207 PORT

## ASSIGN VM/AA

### DESCRIPTION:

Enables SLI ports to be designated as NORMAL or VMAA. VMAA ports will receive digits designated in MMC 726 VM/AA Options and will also receive a true disconnect signal upon completion of a call. Only SLI boards, not key daughterboards, support disconnect signal. Do not make VMAA ports data; this will return them back to a single line port and stop voice mail integration. VMAA ports have the equivalent of data protect written in the program and are protected against tones.

# CUSTOMER ON/OFF PER TENANT

## DESCRIPTION:

Allows the system administrator to set in the system features on a per-tenant basis listed below.

- |      |               |  |
|------|---------------|--|
| 0.   | DISA PSWD     | It toggles ON and OFF to decide whether outside customers are required to enter DISA PASSCODE or not.  |
| 1.   | LCR ENABLE    | This will enable LCR feature to be worked in the system.   |
| 2.   | PERI UCD SET  | Periodic UCD Information provider.<br>Enables UCD Statistics data on a per UCD group basis to print out on the IO port which has been set as SMDR or UCD REPT in real time (every 10 seconds). This allows the information to be interfaced with an extended manipulation by the external package Software third-party provided. |
| 3.   | SMDI VMS SET  | Allows SMDI integration through RS-232 port for the external PC-based VM system.   |
| **4. | DISA MOH      | Gives an additional option to be presented to the outside DISA callers<br>variable indication provided by MOH source instead of fixed DISA dial tone.  |
| **5. | SMDR MASK     | Introduce a new programmable option to mask the last two digits of the telephone number dialed on the SMDR printout.   |
| **6. | XFER MOH      | Callers who have been transferred from an extension or ACD group or AA group will hear MOH until answered by the called extension instead of transfer dial tone.   |
| **7. | DSP SSPDNAME  | LCD will display of programmed name of SYSTEM SPEED bin (in MMC 706) if it has been programmed, otherwise show programmed digits (in MMC 705) even though this MMC turned to ON.   |
| **8. | DDI FBACK→406 | Unanswered DDI call can be routed to an assigned destination in MMC 406 before dropping out the call.  |

- \*\* New option as from SW Version V4.0

# MMC: 212 ALARM RINGING STATION

## DESCRIPTION:

Used to determine which devices will be alerted when an alarm sensor is activated. The alerted device can be as follows:

Station	201-349
Station group	500-529

The above devices will ring like a door phone and follow the door ring time-out. When ringing, display keysets will show the display assigned in MMC 213 Alarm Message. The bottom line of the keyset display will give an option to clear the alarm. Ringing initiated by an alarm sensor is answered by going off-hook and on-hook again at a ringing keyset. If a device such as Ring Over Page or a common bell is the only device assigned to ring, it may be answered by assigning a direct pickup key with this device as the extender. If the alarm is unanswered by the door ring time-out, ringing will cease but the display will remain until cleared by dialing the alarm clear feature code (57) and passcode (default 8765).

## PROGRAM KEYS

# ALARM

## DESCRIPTION:

Allows the assignment of a name to an alarm sensor. Names are written using the dial key pad. Each press of a key will select a character. Pressing the dial key will move the cursor to the next position. For example, if the sensor name is "FIRE," press the number "3" three times to get the letter "F." Now press the number "4" three times to get the letter "I." Continue selecting characters from the table below to complete your message.

NOTE: When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right or the DOWN key to move the cursor left. A space can be entered by using these keys. Pressing the "A" key will change the letter from upper case to lower case.

COUNT	1	2	3	4	5
DIAL 0	Q	Z	.	)	0
DIAL 1	space	?	,	!	1
DIAL 2	A	B	C	@	2
DIAL 3	D	E	F	#	3

# TRUNK NAME

## DESCRIPTION:

Allows a eleven (11) character name to be entered to identify an individual trunk.

Names are written using the key pad. Each press of a key will select a character. Press the desired key to move the cursor to the next position. For example, if the directory name is "SAM SMITH," press the number "7" four times to get the letter "S." Now press the number "2" twice to get the letter "A." Continue selecting characters from the table below to complete your message. Pressing the "A" key will change the letter from upper case to lower case.

NOTE: When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right or the DOWN key to move the cursor left. A space can be entered by using these keys.

COUNT	2	3	4	5	1
DIAL 0	Q	Z	.	)	0
DIAL 1	space	?	,	!	1
DIAL 2	A	B	C	@	2

# ASSIGN DISA TRUNK

## DESCRIPTION:

Allows the system the ability to have Direct Inward System Access (DISA). Because there is a possibility that unauthorized calls will be made via this feature, several safeguards have been added. The end user must be informed of these to prevent unnecessary service calls. DISA can lock out when a predetermined number of invalid consecutive calls are attempted. Callers will then receive error tone until the programmable timer has expired. The \* key may be used to initiate new dial tone while in a station to station call. The # key may be used to terminate the DISA call and disconnect the central office line. *Only one central office call will be allowed per DISA call* but multiple intercom calls are possible.

## ASSIGN TRUNK

### DESCRIPTION:

Allows for the assignment of analogue DID or AC15 PCBs for proper signalling. This MMC is only for analogue type of DID/AC15 trunks. These trunks can also use the translation tables in MMC714. The AC15 trunks are allowed the used of translation tables via MMC416. The signalling condition types are as follows:

### CONDITIONS

IMMEDIATE	DELAYED	WINK
IMMEDIATE	DELAYED	WINK

### PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right

# MMC: 414

# MPD/PRS SIGNAL

## DESCRIPTION:

This MMC assigns CO lines to be accepted either Metering Pulse or Polarity Reversal Signal on a per trunk basis. Metering Pulse detection is required to install Metering Pulse Detection Unit on a trunk card. Polarity Reversal Signal provided by the C.O may be arrived to the system when the other party answers the outgoing call or the outside party clears the call when you are on a C.O line. If the trunk assigned as PRS detection call duration time will be generated on an SMDR record once the PRS has been detected. Moreover, PRS detection is essential for dropping C.O-C.O conversation with unsupervised by the internal party.

### ACTION

1. Press TRSF 414  
Display shows
2. Dial TRUNK number  
OR  
Press UP or DOWN to select trunk and use left or right soft key to move cursor
3. Dial 1 for PRS OR Dial 0 for MPD  
OR  
Press UP or DOWN to scroll through options and use left or right soft key to return to step 2
4. Press TRSF to store and exit  
OR  
Press SPK to store and advance to next MMC

# MMC: 415 REPORT TRUNK ABANDON DATA

## DESCRIPTION:

Allows the system administrator or technician to enable or disable the reporting of abandoned CO calls for which CLIP information has been collected on a per trunk basis.

There are two options for this MMC as follows.

0 REPORT : NO Abandoned call records for incoming calls with CLIP information will not be printed on SMDR or stored in the system call abandon list.

These records will continue to be stored in the station review list.

1 REPORT : YES Abandoned call records for incoming calls with CLIP information will be printed on SMDR or stored in the system call abandon list. These records will also be stored in the station review list.

Note :

In order for these abandoned call records to print on SMDR, in MMC 725 SMDR Options, Option 11 Print Abandoned Call Records must be set to YES.

### ACTION

### DISPLAY

## MMC: 419

## BRI OPTION

### DESCRIPTION:

This MMC is consist of two groups of items. One group is for the "TRUNK" ports as set in MMC423, and the other is for the "STATION" ports.

#### NOTE:

For each BRI access, two adjacent ports are assigned, you only have to change the value for any one of the two ports from a BRI access, then the value for the other port will be changed automatically.

*For those ports programmed as "TRUNK" in MMC423*, display shows "BRI-TRK". And the items are MODE, CHANNEL ANY and DIALSND.

- **MODE**

**P-P NOR:** When BRI line is point-to-point configuration, and didn't subscribe into the DDI supplementary service. Incoming calls are placed as set in MMC406 "TRK RING".

**P-P DDI:** When BRI line is point-to-point configuration, and subscribed into the DID supplementary service. Incoming calls are placed as set in MMC714 "DDI Table". All incoming calls through DDI trunk, ISDN or Analog, will be placed according to the setting of DDI table.

**P-M NOR:** When BRI line is point-to-multipoint configuration, and didn't subscribe into the MSN supplementary service. Incoming calls are placed as set in MMC406 "TRK RING".

**P-M MSN:** When BRI line is point-to-multipoint configuration, and subscribed into the MSN supplementary service. DCS system can manage upto 8 MSN numbers for each MSN BRI access. Incoming calls throug P-MP MSN ports are handled as set in MMC421 "MSN DIGIT". This table is effective only for one BRI access.

- **CHANNEL ANY**

This field can be set to YES or NO. This field is referenced when a user tries outgoing call while that port is busy.

If CHANNEL ANY is NO, user will hear busy tone.

If CHANNEL ANY is YES, the system will check if adjacent port(another B channel in the same BRI access) is free. If the adjacent port is free, the user can call through that port. Otherwise, then, user will hear busy tone.

- **DLSEND**

This field is provided to set the dial sending mode to "enbloc" or "overlap" on an individual port basis.

#### NOTE:

Any changes to MODE option is effective only after restart of the BRI Card. Use MMC 418 to restart the card.

Compared to old S/W, DLRCV option is removed. This is because that in the new code, if sending complete is not included in incomming SETUP message, DCS will wait for additional digits to come automatically.

*For those ports programmed as "STATION" in MMC423*, display shows "BRI-STN". And the items are CHANNEL ANY and POWER FEED.

- **CHANNEL ANY**

*(Same as above description.)*

- **POWER FEED**

This field provides a selection whether power to a BRI access will be supplied or not.

**NOTE:**

Any change to POWER FEED option is effective only after restart of the BRI Card. Use MMC 418 to restart the card.

In BRI-STN, DLSEND and BRI MODE are not included, because DCS uses implicit data for this option. DCS will use en-bloc for DLSEND and P-MP for BRI MODE.

**PROGRAM KEYS**

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right
SPK	Used to store data and advance to next MMC

# PRI OPTION

## DESCRIPTION:

This program allows the system to have the ability of DDI/NORMAL Access and to decide dial sending mode on an individual port basis to OVERLAP or ENBLOCK.

But if you change one port of dial sending mode, all other ports will be set to same dial sending mode.

If your PRI line is not registered for DDI service at the Central Office, you can use NORMAL service (e.g., subaddress or normal trunk incoming service) If you set PRI MODE to DDI, you can service DDI (Direct Dial Inward) to specific station or station group according to DID NUMBER TABLE.

# MMC: 421

# MSN DIGIT

## DESCRIPTION:

Provides a method of assigning a incoming MSN call to a specific station.

If any entry in MSN DIGIT TABLE matches to incoming call's called party number, then either the specific station is altered if it is programmed to Accept the call

OR

the call is cleared if it is programmed to Reject the call.

If the Incoming called party number does not have matching entry in MSN table, then the operator is altered.

Using this operation, you can give each MSN number to specific station and you can give option ; when destination is busy, incoming call must be cleared or camp-on that station to alarm there is another call.

There are total 8 entries on a trunk basis and each entry consists of the following fields.

- |               |  |
|---------------|--|
| 0. DIGITS     | Digits to be received. Wild card(*) is valid entry and 10 digits maximum.  |
| 1. DAY DEST   | Destination in day mode and it could be a station, a station group. Repeat (B) will be acceptable to the system if received-digit is within numbering plan for a station or station group. |
| 2. NIGHT DEST | Destination in day mode and it could be a station, a station group. Repeat (B) will be of same result at 1. DAY DEST.  |
| 3. CALL WAIT  | Toggles YES or NO, if YES then the call will be camped-on at busy destination while NO gives busy indication.  |
| 4. OPTION     | Accept: the selected destination party will be alerted.<br>Rejected: the call is cleared.  |

### NOTE:

For each BRI access, two adjacent ports are assigned, you only have to change the value for any one of the two ports from a BRI access, then the value for the other port will be changed automatically.

# S0 MAPPING

## DESCRIPTION:

This program generates a table by which an ISDN terminal number is mapped into a BRI STATION port.

For detailed description and other MMC-related procedure, please refer to "BRI RELATED MMC PROCEDURE" of this book.

### NOTE:

For each BRI access, two adjacent ports are assigned, so, you only have to map a number into one of the two ports from a BRI access.

In this program you can map only one port to each number. That means you can't use a number in more than 1 BRI access. In the meanwhile, more than one numbers can be mapped into a port and used in a BRI access.

### PROGRAM KEYS

# MMC: 500 SYSTEM-WIDE COUNTERS

## DESCRIPTION:

Used to set the values of the system counters. The counters are listed below with a brief description of each.

- |                             |   |
|-----------------------------|---|
| 1. ALARM REMINDER           | This is the number of times that an alarm reminder will ring a station before canceling. RANGE = 1-99.  |
| 2. AUTO REDIAL              | This is the number of times the system will redial an outside number after the auto redial feature has been activated. RANGE = 1-15.                      |
| 3. DISA INTERCOM CALL       | This counter sets the maximum number of intercom calls that can be made after accessing a DISA line. RANGE = 1-99.  |
| 4. DISA LOCK OUT            | This is the number of attempts the system will allow to incorrectly access a DISA line before locking out the DISA line. RANGE = 1-99.                    |
| 5. NEW CALL                 | This is the number of times the system will allow a user to signal New Call on a C.O. line during one call. RANGE = 1-99.                                 |
| 6. UCD VISUAL ALARM COUNTER | This is the counter to determine giving visual alarm if the number of calls are waiting to be answered in the UCD group is reached to it. RANGE = 0 - 25. |
| 7. UCD AUDIO ALARM COUNTER  | This is the counter to determine giving audio alarm if the number of calls are waiting to be answered in the UCD group is reached to it. RANGE = 0 - 25.  |

## TIMER DESCRIPTIONS

**AA INT DGT TIME:** This timer controls the grace period between dialing valid digits before transferring call to INVALID DEST as set in MMC 733 on a per-plan basis.

**AA NO ACT TIME:** If no digits are received by the AA module, this timer will expire and transfer the call to the destination set in MMC 733 NO ACT DEST:.

**ALERT TONE TIMER:** This timer sets the duration of the attention tone preceding a call to a keyset in the Voice Announce or Auto Answer mode. This tone will also precede a forced Auto Answer call.

**ALM REM INTERVAL:** This timer controls the time length between ring attempts at a station when alarm reminder is set.

**ALM REM RING OFF:** This timer controls the length of the ring cycle duration when alarm reminder is set at a station.

**ATT RECALL TIME:** This is the length of time a transfer recall will ring at a station before recalling the operator.

**AUTO REDIAL INT:** This timer controls the time between attempts after RETRY dialing is set on a station.

**AUTO REDIAL RLS:** This timer controls the duration of a Ring No Answer condition on a retry number dialed before the auto redial is automatically canceled.

**CALLBACK NO ANS:** This timer controls the time before the callback is automatically canceled when a callback detects Ring No Answer.

**CAMP ON RECALL:** This timer controls the duration of time a camped-on call will stay at a destination before recalling to the transferring station.

**CLIP DISPLAY TIME:** The amount of time that the Calling Line ID information remains on the keyset's display.

**CLIP MSG RECEIVE:** The amount of time that the system will allow a valid message from the C.O.

**C.O.-C.O. DISCONNECT:** This timer monitors the duration of a unsupervised conference; when it expires, both trunks are disconnected.

**CONFIRM TONE TIME:** The tone heard when a feature is activated or deactivated.

**DIAL PASS TIME:** This timer is the wait time for preventing the misdialing of an outgoing call. After the last digit has been dialed, the voice path is connected.

**DISA DISCONNECT:** This timer controls the maximum duration of a DISA call.

**DISA LOCK OUT TIMER:** This timer controls the duration of time a DISA call is not allowed to be made after the DISA error counter has expired (MMC 500).

**DISA PASS CHECK:** This timer defines the time period before the system clears the incorrect passcode counter.

**DISPLAY DELAY TIMER:** This timer controls the duration a display is shown in the LCD display. This timer also controls the duration of time that error tone is heard.

**DOOR LOCK RELEASE:** This timer controls the duration of time the door lock relay will be activated.

**DOOR RING DETECT:** This timer controls the duration of time before a call is answered by the door phone.

**DOOR RING OFF TM:** This timer controls the duration of ringing at the door ring destination before automatically canceling.

**E-HOLD RECALL TM:** This timer controls the duration of time a call is held exclusively at a station before recalling.

**EXT. FWD DELAY TM:** This timer controls the External Call Forward feature which will allow a station to ring before the call is placed on external call forwarding.

**FIRST DIGIT TIME:** This timer controls how long the system will wait for dialing to begin before dropping the dial tone and returning the user to error tone.

**HOK FLASH MAX TM:** This timer monitors the duration of a hookswitch flash to ensure that the flash is valid and not a line noise or an accidental hookswitch bounce (LONGEST DURATION).

**HOK FLASH MIN TM:** This timer monitors the duration of a hookswitch flash to ensure that the flash is valid and not a line noise or an accidental hookswitch bounce (SHORTEST DURATION).

**HOOK OFF TIME:** This timer controls the time before dial tone is sent to a single line station.

**HOOK ON TIME:** This timer sets the minimum amount of time that the system will recognize as an SLT hang up.

**INQUIRY RELEASE:** This timer monitors the duration of the interaction of the soft key to determine when to return the LCD back to a normal status. This timer affects only display phones.

**INTER DIGIT TIME:** This timer controls the grace period between dialing valid digits before dropping the call and returning the user back to error tone.

**KMMC DIGIT TIME:** This timer controls the grace period between programming actions while in a programming session. The timer automatically returns the system to secure programming status.

**LCR ADVANCE TIME:** This timer controls the duration of time before selecting the next allowable route when a station is allowed to route advance.

**LCR INTER DIGIT:** This timer controls the grace period between dialing valid digits before dropping the call and returning the user back to error tone.

**MCL DELAY TIME:** This timer controls the time when the system should start transmitting Authorisation code after sending MCL Access code.

**OFF HOOK RING:** This timer controls the duration of time between ring bursts to a user who has a camped-on call.

**OFF HOOK SELECT:** This timer controls the grace period before placing a internal/external call as programmed in MMCs 306 and 307.

**OHVA ANSWER TIME:** This timer controls the time duration of an OHVA call before automatic rejection.

**OVERLAP INT DGT:** This timer controls the grace period between receiving address informations in overlap receiving mode via BRI/PRI line. After expiration of this timer then the system attendant will be alerted .

**PAGE TIME OUT:** This timer controls the duration of a page announcement.

**PAGE TONE TIME:** This timer controls the duration of tone burst heard over the page prior to the page announcement.

**PARK RECALL TIME:** This timer controls the duration of time a call is parked before recalling to the call park originator.

**PC-MMC LOCK OUT:** This timer monitors the PCMMC activity, drops the link if no action is created by PCMMC and returns the system back to secure program status.

**POWER DOWN TIME:** This timer monitors the power to the ROM pack to begin shutdown status.

**RECALL DISCONNECT:** This is the time an attendant recall will ring before being disconnected.

**RECALL WAIT TIME:** This is the time any recall (hold or transfer) continues to recall at your station before it recalls to the operator.

**SMDR START/DIAL PULSE(ROTARY):** This grace period timer starts SMDR recording for rotary dialing. This timer also controls the LCD duration timer on the keysets. The duration time displayed and the SMDR time duration will be the same.

**SMDR START/DTMF:** This grace period timer starts SMDR recording for touchtone dialing. This timer also controls the LCD duration timer on the keysets. The duration time displayed and the SMDR time duration will be the same.

**SYS HOLD RECALL:** This timer determines the time calls can be left on hold before recalling back to the holding station. This is a system-wide timer. Setting timer to 000 will defeat this feature and no recalling will take place.

**TRANSFER RECALL:** This timer determines the time transferred calls ring before recalling. This is a system-wide timer.

**UCDS AUDIO ALARM:** This timer determines the time to give audio alarm to the UCD supervisor if the longest waiting calls are reached to this time.

**UCDS VISUAL ALAM:** This timer determines the time to give vialual alarm to the UCD supervisor if the longest waiting calls are reached to this time.

**VOICE DIAL DELAY:** This timer monitors the duration of the interaction between main software and voice dialer.

# MMC: 502 FORWARD NO ANSWER TIMER

## DESCRIPTION:

Allows the Forward No Answer timer to be changed on a per-station basis or for the entire system.

# MMC: 507 ASSIGN AUTO NIGHT TIME

## DESCRIPTION:

Enters the system into night mode automatically by utilizing time and day tables. A NIGHT key is not needed as the system will switch automatically, it is helpful to have a dedicated button so the status can be manually changed. The start time is the time the system will switch from day to night service and the end time is the time the system will end night service which was set the day before. (e.g., start 1730 WED, end 0800 WED) This prevents entering of start and stop times.

# MMC: 508 COST

## CALL

### DESCRIPTION:

Allows change the system administrator to program attributes of Call Cost to be generated by the system either on LCD during on a call or SMDR record. Attributes are listed below.

- |                     |  |
|---------------------|--|
| 0. UNIT COST PER MP | When the system is installed to receive MP on a CO outgoing call. It is used for generating total call cost by multiplying with the number of pulses. The MMC will allow to enter 5000 as a maximum value. |
| 1. CALL COST RATE   | This will generate additional call cost calculated by multiplying this rate to the original call cost. It ranges fro 100 through 255.  |

#### **WARNING !!!**

***Beware** of changing this value when there is a being progressed CO line under MP detection may result in inaccurate call cost.*

#### PROGRAM KEYS

# CO TONE CADENCE

## DESCRIPTION:

Provides the ability to customize the tone cadence provided from the analog Trunk on a system-wide basis. There are three(3) types of tones available through this MMC. The control of the tone cadence may be changed from interrupt tone to continuous tone. Some DCS systems may require default settings to comply with local operating companies. These tones are mainly used for performing of Automatic Redial Feature depending on call progress tones on request from internal users on a Trunk call.

Once busy tone is detected from the Central Office then the call will automatically be released and will be queued for next trial after expiration of Autoreodial Interval Timer (MMC 501).

NOTE: Consult your local Central Officer about cadences of tones to meet specifications if you encounter any trouble during installation.

# MMC: 510 MESSAGE WAIT LED CADENCE

## DESCRIPTION:

Provides the ability to customize the Message Wait LED cadence. There are two cadences available. The two cadence are CONTINUOUS & INTERRUPT. The LED cadence control may be changed from interrupt to continuous. The default setting of interrupt cadence is from 2000 to 2000.

The two options are as follows ;

- CONTINUOUS : When the Message is accepted to the SLT that has *Message Wait LED*, the *Message wait LED* will be turned on continuously.
- INTERRUPT : On the above state, the LED will be flickered. The flickering interval can be set/changed by MMC.

## DESCRIPTION:

Used to assign members to the operator group. There are several options that can be selected for ringing, overflow, group transfer and overflow destination. There are a maximum of 32 members allowed in one group. The operator group is automatically assigned group number 500.

Note: In DCS/Compact System: maximum 30 of members are allowed in one group.

### FEATURE KEYS

0	RING	Ring mode
1	OVERFLOW	Overflow time
2	GRP TRSF	Group transfer time
3	NEXT PORT	Overflow port
4	MEMBER	Group member (e.g., station 202)

### RING MODES

0	SEQUENTIAL	The first idle station listed in the group will ring. If the first is busy, the next idle station will ring.
1	DISTRIBUTE	The first call will ring the first station listed in the group. The next call will ring the next station listed in the group.
2	UNCONDITION	All the stations listed in the group will ring. Busy stations will receive off-hook ring (MAX 32 STATIONS RINGING).

### PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right
SPK	Used to store data and advance to next MMC
HOLD	Used to clear previous entry

### ACTION

1. Press TRSF 600  
Display shows
2. Dial feature option (0-4, e.g., 3)  
OR  
Press RIGHT soft key to select option and move cursor to next step
3. Press RIGHT soft key to move cursor

### DISPLAY

# MMC: 601 ASSIGN STATION GROUP

## DESCRIPTION:

This program is much like MMC 600 Assign Operator Group but this one is for stations only. The station groups that are available in this MMC will provide more flexibility in the usage of Uniform Call Distribution (UCD), AA GROUP and VM/AA applications. A station, Common bell, and Ring Page can be in more than one group, but must all be the same ring type. There is a maximum of 48 members per group.

### NOTE:

1. A device for announcement if used must provide a hookflash and return the call back to the group. If a station is in more than one group and attempts to use the IOG key, it will be removed from all groups.
2. In DCS/Compact System: maximum 30 of members are allowed in one group.

## GROUP TYPES

0	NORMAL GROUP	
1	VMAA GROUP	Can only have distribute or sequential ringing.
2	UCD GROUP	Has wrapup capability.
3	AA GROUP	Can only distribute or sequential ringing.

Other possible entries:

3801-3820	COM. BELL	This device is a common bell relay on a Trunk A card.
3601-3640	RING PAGE	This device is ring over an external page zone output of a Trunk A card.

## FEATURE KEY

0	TYPE	Group type (Normal, VM/AA, UCD)
1	RING	Ring mode
2	OVERFLOW	Overflow time
3	GRP TRSF	Group transfer time
4	WRAP-UP	Wrap-up time (timer only valid.in type = UCD)
5	NEXT PORT	Overflow port
6	MEMBER	Group member (e.g., station 202)

## RING MODES

0	SEQUENTIAL	The first idle station listed in the group will ring. If the first is busy, the next idle station will ring.
1	DISTRIBUTE	The first call will ring the first station listed in the group. The next call will ring the next station listed in the group.
2	UNCONDITION	All the stations listed in the group will ring, busy stations will receive off-hook ring. MAXIMUM 32 STATIONS RINGING.

## DEFAULT DATA: NORMAL GROUP

**RELATED ITEMS: MMC 203 ASSIGN UA DEVICE  
MMC 204 COMMON BELL CONTROL**

# MMC: 602 STATION GROUP NAME

## DESCRIPTION:

Allows the system administrator or technician to enter a 11 character name to identify an individual station group.

Names are written using the keypad. Each press of a key will select a character. Pressing the next key will move the cursor to the next position. For example, if the directory name is "SAMSUNG," press the number "7" three times to get the letter "S." Now press the number "2" once to get the letter "A." Continue selecting characters from the table below to complete your message. Pressing the bottom left programmable key will change the letter from upper case to lower case.

NOTE: When the character that you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right or the DOWN key to move cursor left. A space can be entered by using these keys.

COUNT	1	2	3	4	5
DIAL 0	Q	Z	.	)	0
DIAL 1	space	?	,	!	1
DIAL 2	A	B	C	@	2
DIAL 3	D	E	F	#	3
DIAL 4	G	H	I	\$	4
DIAL 5	J	K	L	%	5
DIAL 6	M	N	O	^	6
DIAL 7	P	R	S	&	7
DIAL 8	T	U	V	*	8
DIAL 9	W	X	Y	(	9
DIAL *	:	=	[	]	*

The # key can be used for special characters: #, space, &, !, :, ?, ., %, \$, -, <, >, /, =, [, ], @, ^, (, ), \_, +, {, }, |, ;, \, " and ~.

# ASSIGN TRUNK GROUP

## DESCRIPTION:

Allows the assignment of trunks to a specific trunk group or to several trunk groups. This is very useful in the programming of LCR when more than one trunk is to be in several dialing plans. There are two different modes of operation: (1) sequential and (2) distribute.

**WARNING:** As stated above, one trunk can appear in more than one trunk group. If necessary, delete the trunk member from other groups to prevent accidental access.

## PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections

# MMC: 604      ASSIGN STATION TO PAGE ZONE

## DESCRIPTION:

Allows the technician to assign a keyset to any of the four internal paging zones and all page (page plus \*). The total number of keysets that can receive a page is limited to 80. A keyset may be assigned to more than one zone.

The assignment is controlled by the use of class marks. If a keyset is flagged as "1" in a zone column, it will receive pages for that zone. If the keyset is flagged as "0," it will not receive pages for that zone. Keysets can receive pages for more than one zone.

# MMC: 606

# ASSIGN SPEED BLOCK

## DESCRIPTION:

Provide a means of adding or deleting speed dial blocks to the system or an individual keyset. With the ability to delete a block or blocks or speed dial, it will not be necessary to waste these on such items as voice mail, SIMs, DPIMs or for stations that do not require the ability to use speed dial.

The Free List will show how many bins are left to be assigned. One block has a ten (10) entries. DCS has a 1500 entries maximum in a system, 500 for System Speed and 50 on a per station maximum. But DCS/Compact has a 500 entries maximum in a system, 500 for System Speed and 50 on a per station maximum. Accordingly, for instance, if the System Speed block has been assigned as 500 entries then 1000 entries on DCS and 0 on DCS/Compact can be shared by all extensions.

## PROGRAM KEYS

UP & DOWN	Used to scroll through options

TOLL RESTRICTION**

# TOLL RESTRICTION OVERVIEW

The DCS allows each station to be assigned a class of service for use in the day mode and a class of service for use in the night mode. This class of service determines the station's dialing class which can be set to A through H. Class A has no restrictions and Class H is restricted to internal calls only. Classes B, C, D, E, F and G are controlled by the entries listed in the deny table in MMC 702, the allow table in MMC 703 and the wild cards defined in MMC 704.

### TOLL RESTRICTION RULES

1. The deny entries prevent certain numbers from being dialed. The allow entries are ***only*** exceptions to these deny entries.
2. Listing numbers in the allow tables without any entries in the deny tables is the same as having no restriction.
3. A wild card in any position in the deny table means that an exception exists in the allow table for the digits defined by the wild card.
4. A wild card at the end of any allow entry means that more digits may be dialed.
5. Do not put a single wild card as an entry in the allow table.
6. When changing any entry or BCDEFG status, you must enter all digits.

The following examples are provided as an aid to help understand how to use the deny and allow tables. Area codes all have 0 or 1 as a middle digit.

### EXAMPLE 1

This system is installed in an area where seven digits is a free call, 1 + seven digits is a toll call within that area code and 1 + ten digits is a call to another area code. Area codes all have 0 or 1 as a middle digit.

Customer requirements:

- Phones with dialing class B can dial 1 + seven digits and local calls.
- All classes (B, C, D, E, F and G) are restricted (denied) from dialing 0 + calls and all 976 calls.
- Classes B and D are restricted from dialing 1 + any area code + seven digits.
- Classes C and E can dial all area codes.
- All classes can dial 1-800 calls.

**EXAMPLE 2**

This system is installed in an area where seven digits is a free call, 1 + seven digits is a toll call within that area code and 1 + ten digits is a call to another area code. Area codes all have 0 or 1 as a middle digit.

Customer requirements:

- All classes (B, C, D, E, F and G) are restricted from dialing 411 calls, 976 calls, 1-900 calls and 0 + calls.
- Only Class B phones can dial 1-800 numbers.
- Class C phones can only dial local calls, 1 + seven digits and numbers in area code 212.
- Class E phones can only dial 911.

**EXAMPLE 3**

This system is installed in an area where seven digits is a free call, 1 + seven digits is a toll call within that area code and 1 + ten digits is a call to another area code. Area codes all have 0 or 1 as a middle digit.

Customer requirements:

Class B phones are in a national telemarketing group that cannot dial numbers in its own area code (305) but is allowed calls to all other area codes. 1-800 calls are allowed and 1-900 calls are not.

# MMC: 702

# TOLL DENY TABLE

## DESCRIPTION:

Provides a way to make toll restriction very easy and flexible. There are 500 entries allowable in the deny table and each entry index can be assigned to a class of service. Each index can have up to twelve digits. With the use of wild cards (MMC 704 Assign Wild Character), more flexibility can be built into the toll restriction. Wild cards can be used repeatedly in the dial string, limited only to what is allowed or denied in MMC 704. There are six toll levels, B through G, that are programmable. Toll level A is set as unrestricted by default and toll level H is set as in house only by default.

# MMC: 705 ASSIGN SYSTEM SPEED DIAL

## DESCRIPTION:

Enables the assignment of system speed dialing numbers. There are 500 entries available for programming.

Each speed dial number consists of a trunk or trunk group access code followed by a separator and up to 18 digits to be dialed. These dialed digits may consist of 0–9, \*, and #. If the system recognizes a valid trunk or trunk group access number, it will automatically insert the separator.

## PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right
SPK	Used to store data and advance to next MMC
HOLD	Used to clear previous entry
B	Used to insert a flash code "F"
C	Used to insert a pause code "P"
D	Used to insert a pulse/tone conversion code "C"
E	Used to mask/unmask following digits. shows as "[" or "]"
F	Used to enter name for speed dial bin (see MMC 706)

## ACTION

1. Press TRSF 705  
Display shows
2. Dial speed index desired (e.g., 505)  
OR  
Press UP or DOWN key to make selection and press RIGHT soft key to move cursor
3. Enter access code ( e.g., 9/701) plus the phone number up to 18 digits (digits will scroll under) and press RIGHT soft key to return to step 2
4. Press F key to toggle to MMC 706 step 3 to enter name

MMC 606 ASSIGN SPEED BLOCK**

# MMC: 706 SYSTEM SPEED DIAL BY NAME

## DESCRIPTION:

Allows a 11 character name to be entered for each system speed dial location. This name enables the speed dial number to be located when using the directory dial feature. The directory dial feature allows the display keyset user to select a speed dial location by scanning its name.

Names are written using the keypad. Each press of a key will select a character. Pressing a different key will move the cursor to the next position. For example, if the directory name is "SAM SMITH," press the number "7" three times to get the letter "S." Now press the number "2" once to get the letter "A." Continue selecting characters from the table below to complete your message. Pressing the "A" key will change the letter from upper case to lower case.

NOTE: When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right.

COUNT	1	2	3	4	5
DIAL 0	Q	Z	.	)	0
DIAL 1	space	?	,	!	1
DIAL 2	A	B	C	@	2

# LCR TIME TABLE

## DESCRIPTION:

This table allows the flexibility of the system, through the LCR ROUTES, to allow calls placed at any given time of day to use the least cost trunk route that is available. When LCR ROUTE ADVANCE is allowed, it is possible for calls to be placed on more expensive trunks on any given time of day. There are four possible time entries per day; the start time of the next time is the end time of the previous time period.

# LCR ROUTE TABLE

## DESCRIPTION:

The LCR ROUTE TABLE has the responsibility for the selection of a specific trunk group in the completion of an outward bound call. This table works in conjunction with LCR DIGIT TABLE, LCR TIME TABLE, LCR COS TABLE and LCR MODIFIED DIGITS TABLE. After the user dials a valid digit string, the system will use the LCR ROUTE TABLE to select a specific predetermined trunk group. There is a maximum number of 16 routes available beginning with the ROUTE NUMBER 1. If more than one trunk group are available for call completion, the system will use the first designated trunk group and then start to utilize succeeding trunk groups. If all trunk groups are busy in a selected route, call queue will become active and allocate trunks as they become available.

# MMC: 713 LCR MODIFY DIGIT TABLE

## DESCRIPTION:

This program entry, also referred to as Outdial Rules, gives the system the ability to add or delete a digit string or singular digit if needed to complete a call. A perfect example is the adding of a digit "1." An advantage is to insert a common carrier network access code of 10288 (ATT?). With these digits inserted, a long distance call will be placed over a local line utilizing the common carrier network.

The characters \*and # can also be entered.

OPTION	MAXIMUM NUMBER OF DIGIT ENTRIES
Number of digits to delete	15
Insert (before dialing string)	14
Append (after dialing string)	14

### DIGIT STRING KEY

Insert String + Digit String (delete) + Append String

## PROGRAM KEYS

**RELATED ITEMS: MMC 710 LCR DIGIT TABLE**

# MMC: 714 DID NUMBER AND NAME TRANSLATION

## DESCRIPTION:

Provides a method of assigning a incoming DDI call to a specific station. If you registered DDI service in your Local Exchange Network, you can match each DDI number to specific station according to the day or night mode using this operation and you can give option ; when destination station is busy, incoming call can be cleared or camp-on that station to alarm that there is another call. And there is an extra option to adjust the number of digits to be compared by skipping the programmed counts from the first digit point provided by the Network. If there is no matching number in DID NUMBER TABLE, DCS system routes this call to operator group.

There are total 200 entries in the system and each entry consists of the following fields.

- 0. DIGITS                                      Digits to be received. Wild card(\*) is valid entry and 10 digits maximum.
- 1. DAY DEST                                    Destination in day mode and it could be a station, a station group, a trunk and trunk group. Repeat (B) will be acceptable to bypass.
- 2. NIGHT DEST                                Destination in day mode and it could be a station, a station group, a trunk and trunk group. Repeat (B) will be acceptable to bypass.
- 3. CALL WAIT                                 Toggles YES or NO.
- 4. NOF DEL DGT                              Decides the number of digits not to be translated from the first digit received. It is useful when the received digits are consist of subsequent numbers and prefixed with same-digit stream repeated. (i.e., non-significant digit).
- 5. NAME                                        Give name to an individual entry and 11 characters maximum.

Names are written using the keypad in a same manner as SPEED NAME, refer to below table;

COUNT	2	3	4	5	1
DIAL 0	Q	Z	.	)	0
DIAL 1	space	?	,	!	1

# MMC:715 PROGRAMMED STATION MESSAGE

## DESCRIPTION:

Allows a 16 character custom message to be programmed. Messages are written via the keypad. Each press of a key will select a character. Pressing a different key moves the cursor to the next position. For example, if the message is "Sunbathing", press the number "7" three times to get the letter "S". Now press the number "8" twice to get the letter "U". Continue selecting characters from the table below to complete your message. Pressing the "A" key will change the letter from upper case to lower case.

NOTE: When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right or the DOWN key to move the cursor to the left.

COUNT	1	2	3	4	5
DIAL 0	Q	Z	.	)	0

# NETWORK CODE

## DESCRIPTION:

This MMC provides secondary network access code when the call is routed to the secondary network . Maximum entries are up to 16 and 10 digits maximum in length each.

### NOTE:

The second entry may be selected as a primary secondary network. By default, 132(MCL Digital Access). If dialed digits are not matches to the entry in the LCR DIGIT TABLE (MMC 710) and started with 0, then the network code in the second entry will be dialed out by the system prior to transmitting dialed digit.

# MMC: 721      SAVE STATION KEY PROGRAMMING

## DESCRIPTION:

Provides a service tool which will minimize the accidental loss of programmable keys on the DCS electronic keysets. The method of operation is simple—first the data is saved and then the station can be replaced with another station type or the keys can be reprogrammed to other features. Once testing or replacement is completed, the data can be restored to the individual station, providing the same type is in place.

NOTE: This program is not to be confused with AUTO SET RELOCATE. This program is for saving and restoring the same electronic device type at that port.

# MMC: 723 SYSTEM KEY PROGRAMMING

## DESCRIPTION:

This MMC is much like MMC 722 Station Key Programming. The main difference is that this MMC is system-wide rather than on a per station basis. Features are entered via the dial pad key, by pressing the dial pad number the required steps to select the feature. For example, for OHVA, the number 6 is pressed three times. If the BOSS key is required, first press 2 for the first letter B and then use the UP or DOWN key to make the selection from BARGE to BOSS.

NOTE: Please remember that this program is system-wide.

### DIAL KEYPAD

COUNT□	1	2	3

# DIAL NUMBERING PLAN

## DESCRIPTION:

Provide the access codes and dialing plan needed for operation of features and programs. The system comes with a wide range of acceptable numbering plans set as default and the option to customize the dialing plan. There is also an error message provided because of the chance of duplicating an access/feature code. Dialing codes are entered via the dial pad key, by pressing the dial pad number the required steps to select the feature. For example, for OHVA, the number 6 would be pressed three times. If Block Code is required, press 2 for the first letter B and then use the UP or DOWN key to make the selection from BARGE to BLOCK.

NOTE: Please remember that this program is system-wide.

## RELATED ITEMS: ALL PROGRAMS AND FEATURES

### Note:

1. \*\* Added as from Main SW version V4.0

**DECT01-48** assigns desired possible pilot number on a per DECT port.

**MYGRPCK** add to compliment existing group pickup feature which was not comfortable to use by the DCS users who MUST press Group Pickup Code plus two-digit group number. With this numbering code users are just required to press the code to pickup the call ringing within the same group. This means both of ringing and picking up are MUST be in the same pickup group.

**S0 01-32** assigns desired possible pilot number on a per S0 port instead of 7801-7832.

# MMC: 725

# SMDR OPTIONS

## DESCRIPTION:

Allows the system administrator to select the information printed on the SMDR report. The following options may be selected to print on SMDR:

- |                    |   |
|--------------------|---|
| 0. PAGE HEADER     | This option determines whether a page header will print at the top of each page. This would normally be turned off if SMDR is being sent to a call accounting machine.                              |
| 1. LINE PER PAGE   | This option selects the length of each page to determine when to print the SMDR header. The number of lines may be in the range 01-99.  |
| 2. INCOMING CALL   | This option determines whether incoming calls will print on SMDR.   |
| 3. OUTGOING CALL   | This option determines whether outgoing calls will print on SMDR.   |
| 4. AUTHORIZE CODE  | This option determines whether authorization codes will print on SMDR.  |
| 5. LESS START TIME | This option determines whether valid calls will include the minimum call time in total call duration.   |
| 6. IN/OUT GROUP    | This option allows a message, IN GROUP or OUT GROUP, to be printed in the Digits Dialed column each time a station enters or leaves a group.  |
| 7. DND CALL        | This option allows a message, IN DND or OUT DND, to be printed in the Digits Dialed column each time a station enters or leaves DND.  |
| 8. WAKE-UP CALL    | This option determines whether stations receiving an alarm reminder call will print on SMDR.  |
| 9. DIRECTORY NAME  | This option allows the system administrator to enter a 16 character name which will appear on the SMDR header.  |
| 10. CLIP           | This option can be selected to print CLIP data received from the C.O. on incoming ISDN calls. This option requires the use of a 132 column printer or an 80 column printer set for condensed print. |
| 11. ABANDON CALL   | If this option is set to YES unanswered calls will print on SMDR.   |

The DIRECTORY NAME that appears on the SMDR header is programmed as follows:

Names are written using the keypad. Each press of a key will select a character. Pressing the next key will move the cursor to the next position. For example, if the directory name is "SAM SMITH," press the number "7" three times to get the letter "S." Now press the number "2" once to get the letter "A." Continue selecting characters from the table below to complete your message. Pressing the bottom left programmable key will change the letter from upper case to lower case.

NOTE: When the character you want appears on the same dial pad key as the previous character, press the right soft key to move the cursor to the right.

# VM/AA OPTIONS

## DESCRIPTION:

Provides a flexible means of setting in band signaling for voice mail or auto attendant parameters. There are eight main options for programming and several sub-options to customize the application. Main options are listed in bold type with the sub-options listed in normal type. Simple YES/NO, numeric and alpha characters are the requirements needed for the setting of VM/AA.

The following options may be selected for VM/AA operation:

In band signaling OPTIONS LIST 0-7

- |                      |   |
|----------------------|---|
| 0. EXT FOR DN1       | DTMF information for the station that called the VM/AA port station that is forwarded to VM/AA port.  |
| 1. TRK FOR DN1       | DTMF information for the trunk that called the VM/AA port.  |
| 2. EXT FOR DN2       | DTMF information for the station that originated the call to a station that is forwarded to a VM/AA port.   |
| 3. TRK FOR DN2       | DTMF information for the trunk that called a station forwarded to a VM/AA port.   |
| 4. SEPERATOR         | In cases where DN2 is used, this specific digit is sent between the DN1 and the DN2 information. Both DN1, DN2 must be set to YES for SEPERATOR to be sent. |
| 5. DISCONNECT SIGNAL | This signal is sent when the calling station or C.O. line hangs up.   |
| 6. CALL TYPE ID      | Under this VM/AA option is several customizing applications.  |
| 0. DIRECT CALL       | A call originating directly from another station in the system.   |
| 1. ALL FWD CALL      | This indicates that a call was forwarded to the VM/AA port from a station with CALL FORWARD ALL set.  |
| 2. BSY FWD CALL      | This indicates that a call was forwarded to the VM/AA port from a station with CALL FORWARD BUSY set.   |
| 3. NOA FWD CALL      | This indicates that a call was forwarded to the VM/AA port from a station with CALL FORWARD NO ANSWER set.  |
| 4. RECALL            | A call is recalling the VM/AA port after being transferred and not answered.  |
| 5. DIR TRK CALL      | A C.O. call has gone directly to VM/AA (e.g., trunk 717 DIL to VM/AA).  |

- |    |                     |   |
|----|---------------------|---|
| 6. | OVERFLOW            | A call has OVERFLOWED to the VM/AA port from a station group.   |
| 7. | DID CALL            | A DID call has called the VM/AA port.   |
| 8. | MESSAGE CALL        | A message button or message reply feature code has been used to call the VM/AA port.                    |
| 7. | CALL PROGRESS TONES | DTMF digits can be sent in place of normal system tones. Digits can be assigned to the following tones: |

TONES	VALUE
0. DIAL TONE	BA
1. BUSY TONE	4
2. RINGBACK TONE	5
3. DND NO MORE	6
4. HDSET ANSWER	3
5. SPKER ANSWER	2

**NOTE:** Default data of call progress tones will automatically cleared once if the SMDI VMS SET (MMC 210) is turned on.

**PROGRAM KEYS**

# MMC: 728 CLIP TRANSLATION TABLE

## DESCRIPTION:

Allows the system administrator or technician to associate a CLIP number received from the central office with a name programmed in this translation table. If there is no match between a received number and a name in this table, "no CLIP name" will be displayed.

The translation table consists of 250 entries with each comprised of eleven(11) digit telephone number and a 16 digit name.

Names are written using the keypad. Each press of a key will select a character. Pressing the dial pad key will move the cursor to the next position. For example, if the directory name is "SAM SMITH", press the number "7" three times to get the letter "S". Now press the number "2" twice to get the letter "A". Continue selecting characters from the table below to complete your message.

NOTE: When the character you want appears on the same dial pad key as the previous character, press the right soft key to move the cursor to the right.

## MMC: 732

## AA TRANS TABLE

### DESCRIPTION:

This MMC gives more flexibilities to the system by making desired Digit Translation Table, which performs the translation from dialed digit(s) into *destination parts*. *Destination parts* could be an Intercom number, station group, REPEAT, Change Greeting Message Code and AA Plan Table.  
If you selected as REPEAT, dialed digit may be bypassed without translating.

AA TRAN TABLE 01 and 02 can have up to 100 entries each.  
The other tables(03-12) have a 25 entries.

### DESTINATION :

STATION, STATION GROUP, AA TRAN NO, REPEAT and CHANGE GREETING MESSAGE CODE

If you press A Button in DESTINATION field you are able to enter AA TRAN NUMBER. When you wish to enter the same index number( 01-12) of AA TRAN TABLE as being programmed index number, then the system will not accept with the indication of NOT PERMIT on LCD. For instance, if you are in the below step;

```
AA TRAN TB(02)
001: →_
```

if you press A Button then LCD will show P;

```
AA TRAN TB(02)
001: →P_
```

if you enter the same table index number 02 which is being programmed one;

```
AA TRAN TB(02)
001: →P02
```

then you will hear error tone and LCD will show as follows;

```
AA TRAN TB(02)
NOT PERMIT
```

If you press B Button in DESTINATION field you are able to enter REPEAT.

If you press C Button in DESTINATION field you are able to enter CHANGE GREETING MESSAGE CODE.

# AA PLAN TABLE

## DESCRIPTION:

This MMC will be used to build AA PLAN TABLE which consists of main factors, i.e. system prompt messages, decide to the next call flow according to the status of dialed party and assigning dialed digit translation table.

It will be assigned to a specific AA port or a group of AA ports through MMC 735.

There are totally 64 messages on a AA board;

- 48 messages are to be recorded by the user (01-48),
- 16 messages are pre-recorded in ROM on the board (49-64).

It's attributes are as follows;

ATTR	TITLE	DATA	COMSG
0	DAY MSG	01-64	Introduction Message during Day Mode
1	NIGHT MSG	01-64	Introduction Message during Night Mode
2	ALTER MSG	01-64	Emergency Message
3	INVLID MSG	01-64	Message when dialed invalid
4	NO ANS MSG	01-64	Message on no answer reply
5	XFER MSG	01-64	Transfer notifying Message
6	BUSY MSG	01-64	Message on busy reply
7	NO STN MSG	01-64	Message on retrial
8	NO ACT MSG	01-64	Message on no action
8	CAMP	Yes/No	Allow Camp-on onto busy extension
9	ANS DELAY	01-10	Delaying until answer (sec)
10	RETRY CNT	0-5	Count for allowing retry on faulty
11	TRANS TABLE	01-12	Assigning associated TRANS TABLE
12	BUSY DEST	DEST	Alternative destination on busy
13	NO ANS DEST	DEST	Alternative destination on no answer
14	NO ACT DEST	DEST	Default destination on no action
15	INVALID DEST	DEST	Default destination on invalid action

There are totally 12 tables (01-12) maximum in the system and not necessary to be programmed all tables.

**DESTINATION** : STATION,STATION GROUP,AA PLAN NO, REPEAT.

# DECT SYSTEM CODE

## DESCRIPTION:

This **MMC737 DECT SYSTEM CODE** will be used for control the codes of DECT systems which made by SAMSUNG. This MMC is composed of two fields(SYSTEM ID and AUTH CODE). SYSTEM ID is composed of 3-hexadecimal digits(range : 011 ~ FFF) to distinguish between SAMSUNG DCS Key Systems(DECT). This SYSTEM ID code will be provided by SAMSUNG per DCS key system and the code is unique. The dealer or installer of SAMSUNG DECT system must program this unique SYSTEM ID value using this MMC when DECT system is installed at the sites. Whenever DECT system installer wants to register DECT handset, installer must input the AUTH(Authentication) Code that DECT system has. At this time DCS key system compares that Authentication Code is same or not. If the system code is same as DECT system has, DECT system continues the registration procedures. Otherwise DECT system rejects registration procedure. Authentication Code is organized 4-hexadecimal digits(0000 through 9999; default value is 1590). After the registration of DECT handsets is completed using this MMC, the Codes(SYSTEM ID and AUTH CODE) should not be changed to avoid modification of Data Base for DECT registration information.

NOTE : The SYSTEM ID value must be greater than **011**.( SYSTEM ID range : 011 ~ FFF)  
If a system installer wants to register DECT handset, the installer must change the SYSTEM ID that has range from 011 to FFF.

## PROGRAM KEYS

UP & DOWN	Used to scroll through options

# MMC: 738 CLEAR REGISTRATION

## DESCRIPTION:

This MMC is used for deleting the registered information of DECT handset. This will erase the information of DECT handset that has been saved previously.

This MMC has three modes.

First, **FORCED** mode. When this mode is programmed, DCS system clear the information of registration by force.

Second, **MANUAL** mode. Whenever DCS system wants to clear the registration of DECT handset, DCS system must take a confirmation from DECT handset. If the confirmation is SUCCESS, DCS key system clear the registration of DECT handset( If the confirmation is FAILURE, DCS system can't clear the information).

Third, **ZAP** mode. Whenever DCS system wants to forbid using specific DECT handset, DCS system must select this mode. (This method is different from FORCED mode)

# ASSIGN TENANT GROUP

## DESCRIPTION:

Allows the assignment of tenant groups on a per-cabinet, slot and port basis. The simple rule is Cabinet-Slot-Port= Tenant. The simplicity of this program allows for flexible assignments. The only information needed is the correct correlation of entries.

## PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right
SPK	Used to store data and advance to next MMC

## ACTION

## DISPLAY

1. Press TRSF Display shows	TENANT GROUP C:1 S:1 P:01 T:1
2. Enter cabinet number if no change press RIGHT soft key to move cursor	TENANT GROUP C:1 S:1 P:01 T:1
3. Enter slot number if no change press RIGHT soft key to move cursor	TENANT GROUP C:1 S:1 P:01 T:1
4. Enter port number if no change press RIGHT soft key to move cursor	TENANT GROUP C:1 S:1 P:01 T:1
5. Enter tenant number if no change press RIGHT soft key to return to step 2	TENANT GROUP C:1 S:1 P:01 T:1
6. Press TRSF to store and exit OR Press SPK to store and advance to next MMC

# MMC: 804 SYSTEM I/O PARAMETER

## DESCRIPTION:

Provides a means of setting parameters for the SIMs (Serial Interface Modules) to work with one of the followings:

- a personal computer
- with SMDR recording
- with UCD statics report/periodic UCD informations
- CTI(TSAPI) interface.

Programming can be accomplished easily with the tables below to customize any SIM port.

### PARAMETER OPTIONS

Dial 0	Service	Type of Service
Dial 1	Baud Rate	Speed
Dial 2	Char Length	Character Length
Dial 3	Parity	Parity Bit
Dial 4	Retry Count	Number of Retries
Dial 5	Stop Bit	Stop Bit
Dial 6	Wait Time	Message Wait Time
Dial 7	SIM Pair	Station Number Connected to SIM

### SERVICE TYPE

Dial 0	PCMMC	PCMMC
Dial 1	SMDR	SMDR
Dial 2	CTI	Dedicated Switch Link Interface
Dial 3	CTI/SMDR	Switch Link Interface along with SMDR
Dial 4	UCD REPT	UCD Report on request by the Supervisor or daily
Dial 5	SMDR/UCD	Both SMDR and UCD Report will be generated
Dial 6	Not used	

### SPEED

Dial 0	1200 bps
Dial 1	2400 bps
Dial 2	4800 bps
Dial 3	9600 bps
Dial 4	19200 bps

### CHARACTER LENGTH

Dial 7	7 bits
Dial 8	8 bits

### PARITY

Dial 0	None
Dial 1	Odd
Dial 2	Even

### STOP BIT

Dial 1	1 bit
Dial 2	2 bit

## PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right
SPK	Used to store data and advance to next MMC
HOLD	Used to clear entry (when valid)

## ACTION

1. Press TRSF 804  
Display shows
2. Enter in desired port via dial key pad (e.g., 2)  
OR  
Press UP or DOWN key to make selection and press RIGHT soft key to move cursor
3. Enter parameter desired via dial key pad (e.g., 7) from the above option list  
OR  
Press UP or DOWN key to make selection and press RIGHT soft key to move cursor
4. Enter in station number of desired SIM via dial keypad (e.g., 2902)  
OR  
Press UP or DOWN key to display SIM(s) and press RIGHT soft key to return to step 2
5. Press TRSF to store and exit  
OR  
Press SPK to store and advance to next MMC

# TX LEVEL

## DESCRIPTION:

Allows the system administrator to set the base level of TX volume. There are eight (8) levels those are able to be controlled by the VOL UP and DOWN key on keyset. And maximum controllable levels in the system are eleven (11) maximum. Before this MMC, users can vary just eight levels. So it gives the most flexibility to the system administrator so he can classify any desired eight(8) levels within eleven (11).

### PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right
SPK	Used to store data and advance to next MMC

# RESET SYSTEM

## DESCRIPTION:

Provides two methods of restarting the system. The first method restarts the system and clear all memory. The second method restarts the system only. If clear all memory is selected, only the default data will return. Extreme care should be taken when using this MMC.

If the system is restarted, all voice/data connections are dropped.

If memory is cleared, all customer data is deleted and system returns to defaulted status.

## PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right

## ACTION

1. Press TRSF 811  
Display shows
2. Press UP or DOWN key to make selection (RESET SYSTEM or CLEAR MEMORY)  
After selection is made, press RIGHT soft key to move cursor to YES/NO option
3. Press UP or DOWN key to make selection and press RIGHT soft key
4. Press UP or DOWN key to make selection and press RIGHT soft key  
*This will erase all data in the system*
5. System will return with default time and date and default extension number  
OR  
If system just restarted, it will return to normal programmed status
